

4. List out any 3 tags e learned in this module and give a brief explanation about the tags ?

- **<html>** tag: The <html> tag is the root element of an HTML document. It defines the entire document.
- **<head>** tag: The <head> tag defines the head of the HTML document. It contains information about the document, such as the title, the author, and the keywords.
- **<body>** tag: The <body> tag defines the body of the HTML document. It contains the content of the document, such as text, images, and links.

These are just a few examples of the many HTML tags that are available. HTML tags are used to structure and format web pages. They can be used to create headings, paragraphs, lists, tables, and other elements.
